

ABSTRACT

A porous cellulose aggregate which has a secondary aggregation structure formed by the aggregation of primary cellulose particles, has a pore volume within a particle of $0.265 \text{ cm}^3/\text{g}$ to $2.625 \text{ cm}^3/\text{g}$, contains I type crystals, has an average particle diameter of more than $30 \text{ }\mu\text{m}$ and $250 \text{ }\mu\text{m}$ or less, has a specific surface area of 1.3 to $20 \text{ cm}^2/\text{g}$, has an angle of repose of 25° or more and less than 44° , and has the property that it collapses in water.
